

## Petroleum Vapor Intrusion from Subsurface to Indoor Air: Basics

in

Workshop 7: Assessment and Evaluation of Vapor Intrusion at Petroleum Release Sites

Tuesday, March 19, 2013; 6:30 pm to 9:30 pm

23<sup>rd</sup> Annual International Conference on Soil, Water, Energy, and Air

Mission Valley Marriott San Diego, California

March 18 - 21, 2013

George DeVaul  
[george.devaul@shell.com](mailto:george.devaul@shell.com)

1

## Workshop Agenda

- Welcome, Introductions, Safety Issues
- Update on ITRC VI Workgroup
- Update on EPA OUST
- **PVI Overview**; BioVapor and other models; and Introduction to Exclusion Criteria
- Evaluating the Vapor Intrusion Pathway - Studies **45 minutes**
- Regulatory updates effecting sampling and Analysis
- Case Studies/ Lessons
- Summary

2

## Basics – Introduction – PVI Overview

To Be Covered:

- Conceptual Models
- Biodegradation
- Building Foundations and Oxygen

3

## Conceptual Model for Vapor Intrusion:

*Regulatory Framework*

**KEY POINT:** Much of existing regulatory guidance is focused on building impacts due to vapor migration.

## Vapor Flow: Barriers and Limits

- **Buildings**
  - Air exchange, positive pressure, background
- **Building Foundations**
  - Intact (no cracks or unsealed penetrations)
- **Vadose Zone**
  - High soil moisture or clay (no vapor migration)
  - **Aerobic biodegradation**
  - Lateral offset
- **Source and Groundwater**
  - Clean water lens over source, Clay layers
  - Finite source mass, Saturated vapor limits

**KEY POINT:** Presence of subsurface source does **not** always result in observed vapor intrusion.

5

## Petroleum Hydrocarbons And Chlorinated Hydrocarbons Differ In Their Potential For Vapor Intrusion

USEPA OUST 2011, [www.epa.gov/oust/cat/pvi/pvicvi.pdf](http://www.epa.gov/oust/cat/pvi/pvicvi.pdf)

Figure 1. Typical petroleum hydrocarbon transport conceptual scenario

Figure 2. Typical chlorinated solvent transport conceptual scenario

**KEY POINT:** USEPA says that vapor intrusion risk is much lower at petroleum sites.

6

## Basics – Introduction - PVI

### To Be Covered:

- Conceptual Models

- Biodegradation

- Building Foundations and Oxygen

7

## Petroleum VI - Biodegradation

- Biodegradation ... is significant

- Regulation & guidance:

- US EPA. 2002.

- US EPA. 2005. EPA/600/R-05/106.

- ITRC. 2007.

- US EPA. 2011.

- Others ...*

8

## Biodegradation of Petroleum Chemicals

### In 100+ years of publications:

- **Biodegradation Reported for:**
  - solid, liquid, gases (methane & up)
  - straight, branched, ring(s), C-, C=;
  - by many species, 30+ genera bacteria, 25+ genera fungi, algae
    - not every chemical degraded by every species
  - marine, freshwater, sediments, soils
  - in direct metabolism and co-metabolism (co-oxidation)
  - Producing
    - Biomass
    - intermediate products (alcohols, aldehydes, organic acids)
    - ultimate mineral products: CO<sub>2</sub>, H<sub>2</sub>O

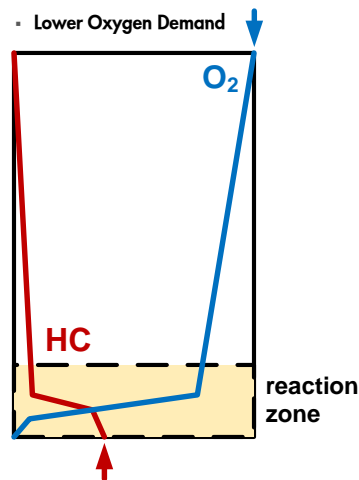

### Observations:

- **Fast acclimation times**
  - absent other limits, by:
    - population enrichment (fast biomass growth)
    - and/or plasmid transfer
    - acclimation times can be affected by prior exposure
- **Environmental Conditions:**
  - 0° < to 70°C
  - salinity up to 25% NaCl
  - pH from 6 to 10
  - optimum conditions can be narrower
- **Redox Conditions**
  - **Aerobic**
    - equally good in range from 0.5 to 30 mg/L aqueous dissolved oxygen
  - **Anaerobic**
    - observed, not ubiquitous
    - other electron acceptors present (nitrate, sulfate, etc.) [strict or facultative], or
    - including fermentive / methanogenic conditions

Reviews of petroleum biodegradation:  
 Zobell, C. E., *Bacteriological Reviews*, 1946, 10(1-2): 1-49. 182 refs.  
 Atlas, R. M., *Microbiological Reviews*, 1981, 180-209. 305 refs.  
 Leahy, J. G.; Colwell, R. R., *Microbiological Reviews*, 1990, 305-315. 157 refs.

## Observed Soil Gas Profiles

- **Lower Concentration Source**
  - Dissolved Groundwater Source
  - Clean Soil Model
  - Lower VOC flux
  - Lower Oxygen Demand
- **Higher Concentration Source**
  - LNAPL Source
  - Dirty Soil Model
  - Higher VOC Flux
  - Higher Oxygen Demand

10

## Aerobic Biodegradation in Soils: Factors

### Food (Substrate)

Energy for growth and maintenance  
Bioavailable (water-phase) •

### Biomass

Concentration  
Species diversity  
History (Acclimation)  
Food to Biomass Ratio •  
Nutrients

### Oxygen

Presence •

### Inhibition

Absence of Moisture •  
Toxic Intermediate Compounds

### Transport

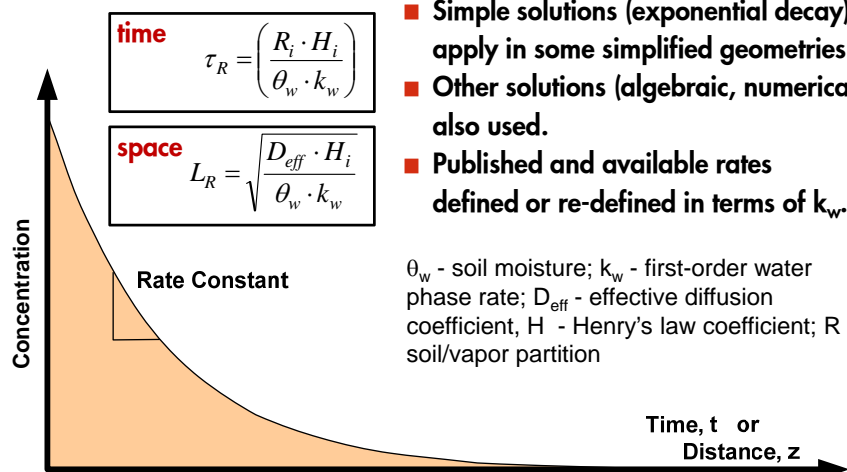

Through bulk soil matrix

Diffusion within soil matrix (at and below scale of soil particles) •

Between chemical phases (water, soil gas, sorbed, LNAPL)

11

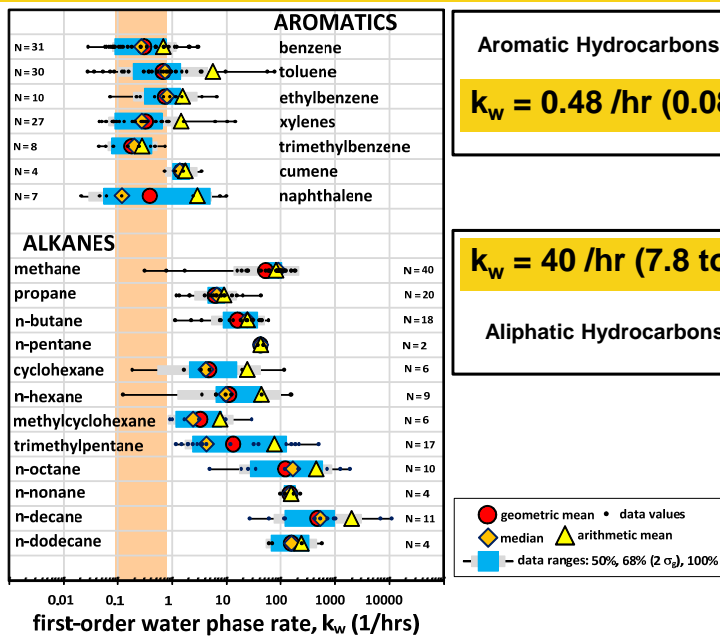

## Exponential Decay: Data Analysis & Scaling

*other conditions similar: aerobic throughout*

12

## Results: Aerobic Petroleum Biodegradation Rates in Soil

**Aromatic Hydrocarbons**  
 $k_w = 0.48$  /hr (0.08 to 3.0)

**Aliphatic Hydrocarbons**  
 $k_w = 40$  /hr (7.8 to 205)

13

## Data Sources: references

14

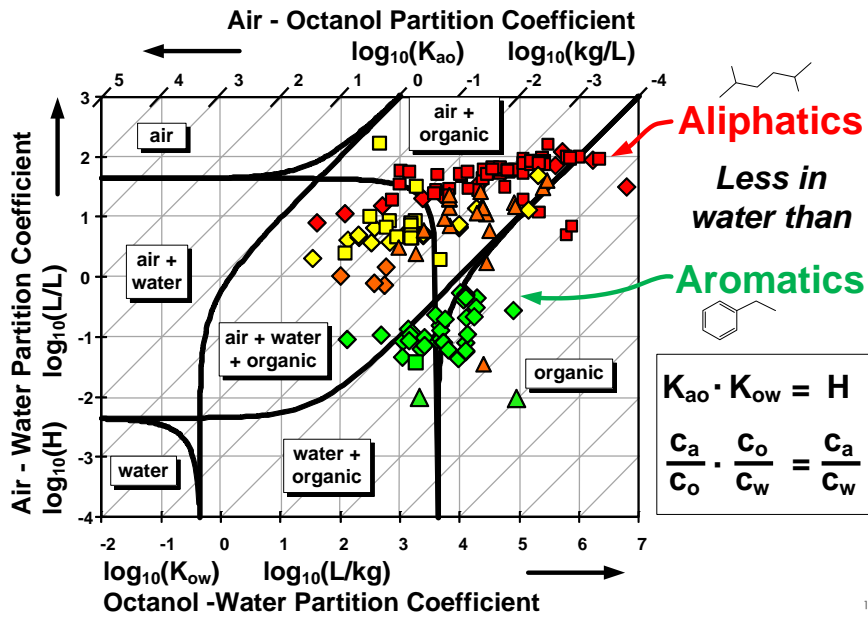

## Constraints on Kinetic Data and Application

- Tabulated Rates Okay for Most Vadose Zone Soils
- Maybe Not: Near active vapor pumping points, capillary fringe, water-saturated soils, high NAPL loading. Due to:
  - Potential non-equilibrium local soil partitioning, or
  - Diffusion-limited biological reaction

15

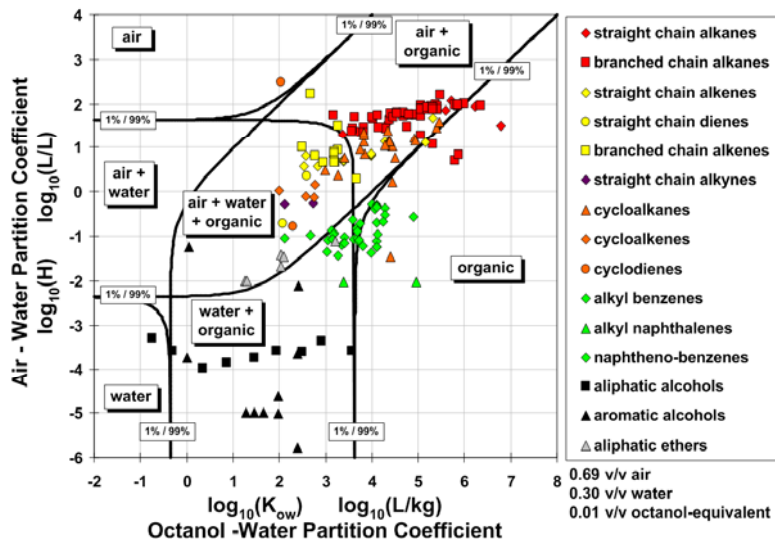

## Petroleum Chemical Phase Partitioning in Soil

16

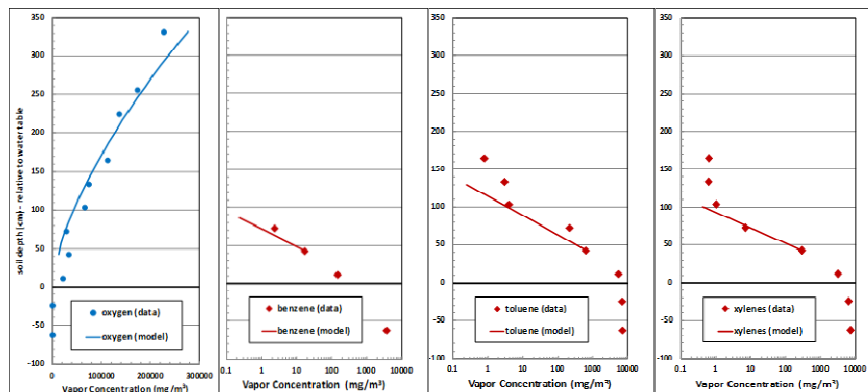

## ... and alcohols

17

## Beaufort, South Carolina

- Measured data to BioVapor Model comparison (using these rates)
- Favorable comparison of petroleum & oxygen concentrations

Data: Lahvis et al., *Water Resources Research*, 1999, 35, 3, 753-765.

18

## Basics – Introduction - PVI

To Be Covered:

- Conceptual Models

- Biodegradation

- Building Foundations and Oxygen

19

## Oxygen Under Building Foundation

### Key Question:

- Is there enough oxygen below building foundations to support aerobic biodegradation?

20

## Building Foundation Types and Air Flow

“Open / breezy” foundation: high airflow

- Raised buildings: on stilts, piles, piers:
  - Due to unstable soils, wet soils (expansive clays, muskeg, bogs, swamps) or climate (air circulation, termites, flooding).

“Airtight” Foundations - limited airflow:

- Slab-on-grade. Basements.
- Crawlspace.
  - Edge walls depth: frost heave
  - Influenced by capillary break or vapor barriers [moisture control]

Buildings may be “airtight” or “open / breezy” depending on soils.  
Suggestion: If unknown, choose nominal “worst case” for the area.

21

## Oxygen Under Foundation: Model Prediction

- Numerical model predicts oxygen shadow below building, but.....
- Very strong vapor source (200,000,000  $\mu\text{g}/\text{m}^3$ )
- All flow into building is through perimeter crack
- No advective flow directly below building

**KEY POINT:** This model does not account for key oxygen transport processes.

From Abreu and Johnson, ES&T, 2006, Vol. 40, pp 2304 to 2315

22

## Aerobic Biodegradation: Mass Balance

Hydrocarbon + Oxygen  $\xrightarrow{\text{microbes}}$  Carbon Dioxide + Water

1 kg C<sub>x</sub>H<sub>y</sub> + 3 kg O<sub>2</sub>  $\longrightarrow$  3.4 kg CO<sub>2</sub> + 0.7 kg H<sub>2</sub>O

- 21% oxygen ( = 275 g/m<sup>3</sup>)
- Provides capacity to degrade 92 g/m<sup>3</sup> hydrocarbon vapors

**KEY POINT:** Even limited migration of oxygen into subsurface will support significant aerobic biodegradation.

23

## Transport of Oxygen Under Foundation

- Wind Driven Advection
  - lateral pressure upwind / downwind
- Bi-Directional Pressure Flow Across Foundation (back and forth)
  - Time-dependent pressure fluctuations
  - Indoor VOCs detected in sub-slab samples (McHugh)
- Indoor-Subsurface Pressure gradient (steady)
  - Mean flow volume balance (out = in)
- Oxygen Diffusion through Concrete (Large Area)
  - Measured diffusion rates are not zero

24

## time-dependent pressure

- Back-and-forth:
  - air flow follows pressure gradient

- warm days and cold nights
  - Induced: Furnace cycling
  - Direct: Temperature differences, wind
- Varies with building & season

25

## Oxygen Blow Buildings

- Summary:
  - Even modest oxygen transport yields sufficient aerobic biodegradation in most cases
  - Oxygen demand (from high hydrocarbon source) can deplete oxygen below building foundations and capping layers.

### ■ Very Large Buildings ?

- Refinery site: Perth, Australia (Patterson and Davis, 2009)
- Measured Depleted Oxygen below Building Center
- 35 to 40 g/m<sup>3</sup> hydrocarbon vapor above LNAPL at 10 feet depth

### Two key factors – both needed:

1. Limited oxygen transport below the foundation &
2. High oxygen demand

26

## Conclusion: Introduction Overview

### *Subsurface source to indoor air vapor intrusion*

#### **Actual Issues: Petroleum VI**

- Occur very infrequently
  
- Occur (sometimes) with:
  - Very large releases of petroleum to the subsurface
  - Petroleum LNAPL very close, in contact with, or inside a basement or utility connected to an enclosure

27

## Workshop Agenda

- Welcome, Introductions, Safety Issues
- Update on ITRC VI Workgroup
- Update on EPA OUST
- PVI Overview; **BioVapor and other models**; and Introduction to Exclusion Criteria
- Evaluating the Vapor Intrusion Pathway - Studies **45 minutes**
- Regulatory updates effecting sampling and Analysis
- Case Studies/ Lessons
- Summary

28

## BioVapor Model

### To Be Covered:

- Model Introduction

- Application Examples

29

## J&E Model: Subsurface Vapors to Indoor Air Vapor Intrusion

- Johnson and Ettinger (1991): Heuristic model for predicting the intrusion rate of contaminant vapors into buildings, Environ. Sci. Tech., 25:1445-1452.
  - Applied: ASTM E2081-00; E1739-95; USEPA, 2003; others
- USEPA OSWER - Subsurface Vapor Intrusion Guidance (2002):
  - “The draft guidance recommends certain conservative assumptions that may not be appropriate at a majority of the current 145,000 petroleum releases from USTs. As such, the draft guidance is unlikely to provide an appropriate mechanism for screening the vapor pathway at UST sites.”
- Tillman, F.D. and J.W. Weaver, 2005, Review of recent research on vapor intrusion, EPA/600/R-05/106
  - “While caution would require the evaluation of the soil-to-indoor air pathway for all subsurface contamination, there are, in fact, not many cases of proven vapor intrusion documented in the scientific literature. This is particularly true for organic vapors subject to aerobic biodegradation, such as gasoline compounds (petroleum hydrocarbons).”

30

31

## BioVapor: Intended Application

yes

- Improved understanding of Petroleum Vapor Intrusion
- Calculate oxygen concentration / flux required to support aerobic biodegradation
- Identify important model input parameters and output variables – and their sensitivity
- Available, free

no

- Predict hydrocarbon concentrations in indoor air within a factor of 10
  - Site complexity
  - Temporal variability
  - Indoor background

32

## Model Use Comparison

### *Many models are available ... tradeoffs*

- **Complex:** numerical, multi-dimensions, time-dependent
  - intensive computation, potentially few users
  - Explore building / foundation interaction details
  - Lateral building / foundation to source separation
  - Can be 'stiff' (numerically unstable)
- **Simple:** analytical, semi-analytical, one-dimension
  - Very fast calculations
  - Multiple chemicals, oxygen sinks, no problem
  - Sensitivity estimates are realistically possible
  - Insight into trends, sensitivity, key parameters
  - Easily coded and run

Yao and Suuberg, 2013: A Review of Vapor Intrusion Models, ES&T

33

## API BioVapor: Use

- **Structure**
  - Menu-driven
  - Microsoft Excel™ spreadsheet
    - Open, unlocked, reference guidance
- **Input:**
  - Same or similar parameters as Johnson & Ettinger model
    - Similar conceptual model & caveats on model applicability and use.
    - Includes 'oxygen-limited aerobic biodegradation' (DeVaul, ES&T 2007)
  - Additional Parameters and Information
    - Either can be readily estimated, or
    - Included in database (example: chemical-specific aerobic degradation rates)

### Key:

- Quantify the contribution of aerobic biodegradation
- Available and relatively easy to use

34

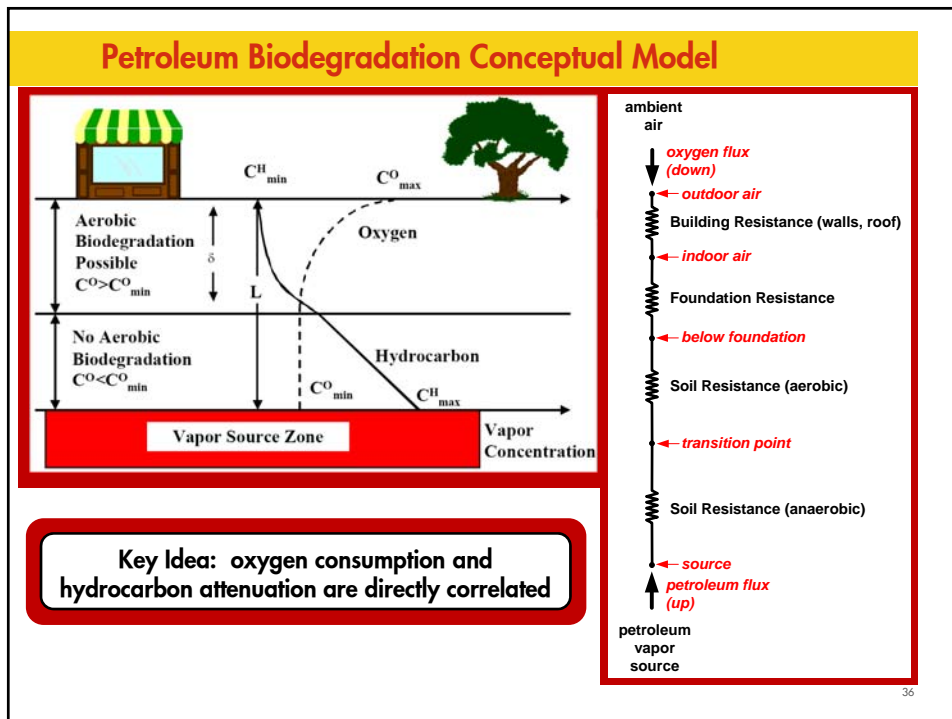

## BioVapor: Menus & output

The screenshot displays the BioVapor software interface, which is used for modeling vapor intrusion. It features several key components:

- Results Charts:** A graph on the left shows 'Chemical and Oxygen Concentration vs. Depth' with a y-axis from 0 to -300 and an x-axis for 'Normalized C'. It includes curves for 'Hydrocarbon' (red) and 'Oxygen' (blue).
- Input Parameters:**
  - 1. Oxygen Boundary Condition:** Includes 'Vapor Limit Concentration Within Building'.
  - 2. Exposure and Risk Factors:** Includes 'Target Hazard Quotient For Individual Chemicals' (1.00), 'Target Fractional Individual Risk: Chronic Risk' (1.0E-06), 'Carcinogen Susceptibility' (10.00), 'Risk Assessment Averaging Time' (365.00), 'Worst-Case - Adult' (10.00), 'Exposure Duration' (30.00), 'Exposure Frequency' (35.00), and 'Indoor Infiltration Rate Correction Factor' (1.00).
  - 3. Building Parameters:** Includes 'Indoor Ceiling Height' (244.00), 'Air Exchange Rate' (0.05), 'Permeability of the Floor' (1e-09), 'Foundation Area' (1000000.00), 'Foundation Crack Location' (31.731.04), 'Soil Permeability (Equivalent Cracks)' (1.00), 'Water Filled Porosity (Soil-filled Cracks)' (0.00), 'Junction Through (Horizontal) Foundation' (111.000), and 'Building Envelope Porosity/Leakage' (0.02).
  - 4. Various Zone Parameters:** Includes 'Soil Porosity' (0.20), 'Soil Water Content' (0.02), 'Soil Slopes: Carbon Fraction' (0.01), 'Soil Density - Bulk' (1.70), 'Porosity Under Foundation' (0.20), 'Depth of Aerobic/Anaerobic Transition' (21.00), 'O<sub>2</sub> Concentration Under Foundation' (10.00), 'Annual Median Soil Temperature' (10.00), 'Maximum Soil Oxygen' (1.00E-03), and 'Minimum O<sub>2</sub> Conc. For Aerobic Diodes' (1.00E-03).
- Forward Risk Calculation:** A table on the right shows 'Predicted Indoor Air Concentration' and 'Risk Level'.
- Navigation:** Buttons for 'Home', 'Print', 'Previous', and 'Next' are visible throughout the interface.

35

## Petroleum Biodegradation Conceptual Model

36

## Oxygen below Buildings: Basis

### ■ Aerobic Biodegradation

- Hydrocarbon to Oxygen use ratio: 1 : 3 (kg/kg)
- Atmospheric air (21% Oxygen; 275 g/m<sup>3</sup> oxygen) provides the capacity to degrade 92 g/m<sup>3</sup> hydrocarbon vapors (92,000,000 ug/m<sup>3</sup>)

### ■ Oxygen below a Foundation: can it get there?

- Through the foundation
  - Equate to same transport parameters as other VI chemicals
- Around the foundation edges (bonus)
  - Additional oxygen

#### Key: Oxygen below a foundation

- Can oxygen get there?
- Is there enough oxygen to support significant aerobic biodegradation?

37

## Oxygen in the BioVapor Model

### ■ Three Options:

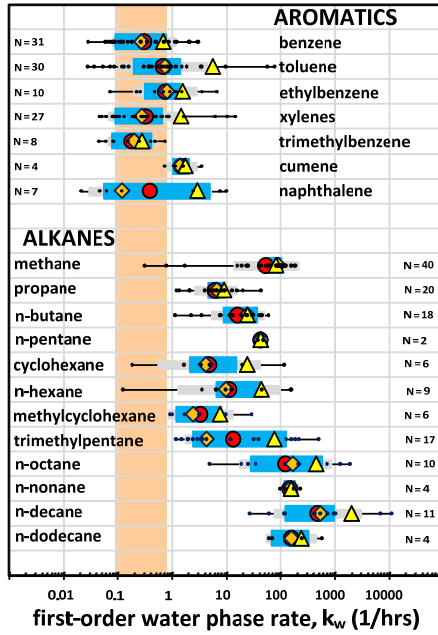

1. **Specify Aerobic depth**
  - Measure vapor profile
2. **Specify Oxygen concentration under a foundation**
  - Measure oxygen
3. **Let the model balance hydrocarbon & oxygen consumption**
  - Specify vapor source composition (gasoline vapor, etc.)
  - Estimate or measure hydrocarbon source

#### Key:

- Pick one method; the others are related (and predicted)
- Relatively unique to this model (particularly #3)

38

## Aerobic Petroleum Biodegradation Rates in Soil

**Aromatic Hydrocarbons**  
 $k_w = 0.48$  /hr (0.08 to 3.0)

**Aliphatic Hydrocarbons**  
 $k_w = 40$  /hr (7.8 to 205)

● geometric mean   ● data values  
 ◆ median   ▲ arithmetic mean  
 — data ranges: 50%, 68% ( $2\sigma$ ), 100%

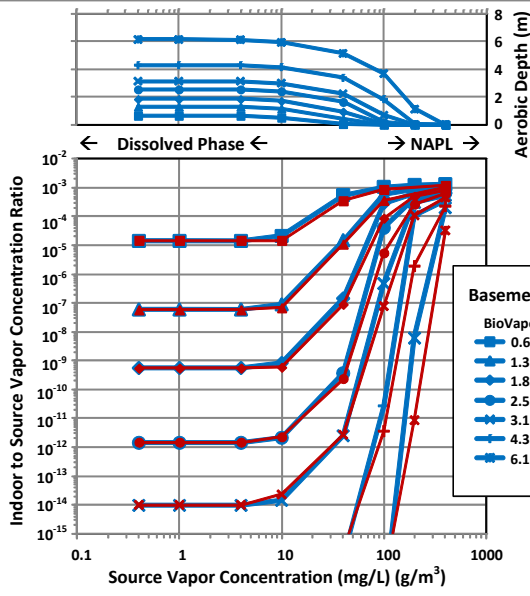

• **Chemical-Specific Rates**

DeVaul, 2011: *Biodegradation rates for petroleum hydrocarbons in aerobic soils: A summary of measured data*, International Symposium on Bioremediation and Sustainable Environ. Technol., June 2011, Reno.

'reaction length' 
$$L_R = \sqrt{\frac{D_{eff} \cdot H_i}{\theta_w \cdot k_w}}$$

39

## Model Application 1: Compare 1-D to 3-D Estimates

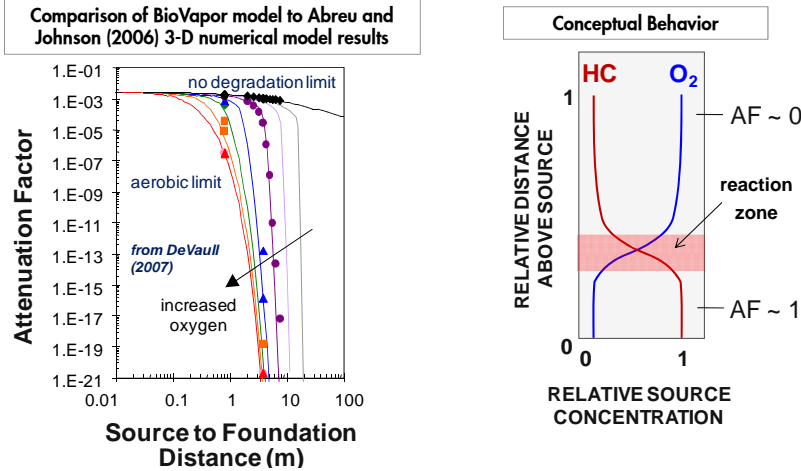

- 3D: Abreu 2009: GWM&R & API Publ. 4555
- Basement Scenario
- Matched Parameters
- Except "Depth"

**Basement Scenario**

BioVapor	Abreu (2009) 3D
0.65 m	1 m
1.3 m	2 m
1.8 m	3 m
2.5 m	4 m
3.1 m	5 m
4.3 m	7 m
6.1 m	10 m

## Model Application 1: Compare 1-D to 3-D Estimates

- 3-D (Abreu) and 1-D (BioVapor) model
  - Matched scenarios, oxygen demand & availability, chemical kinetics
  - DeVaul, 2007: A&WMA VI Conference, Providence, RI.
- Both models show a distance beyond which indoor impacts are virtually negligible

41

## Application 2 – Measured Data to BioVapor Comparison

- Beaufort, South Carolina
  - Favorable comparison of petroleum & oxygen concentrations

Data: Lahvis et al., *Water Resources Research*, 1999, 35, 3, 753-765.

42

## Application 2 – Measured Data to BioVapor Comparison

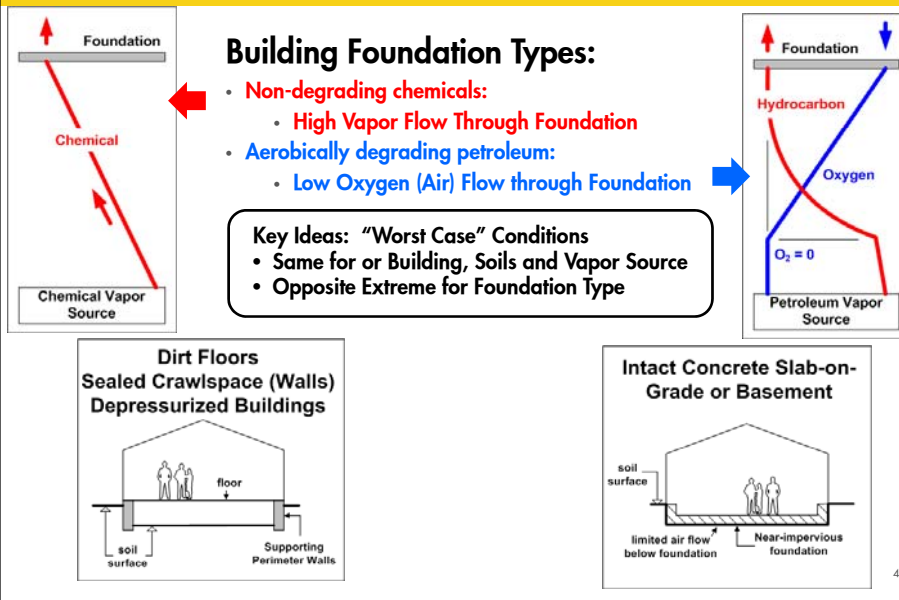

### Ratio of indoor to source vapor concentration: BTEX

43

## Model Application 3: Extreme Conditions

### Potential “worst case” indoor air concentrations

44

## Model Application 4: Sensitivity Analysis

Is a proposed exclusion distance okay for varied buildings?

### ■ Base Case 'Exclusion Distance':

- 5 ft separation, water-dissolved source
- 1 mg/L benzene, 10 mg/L BTEX
- Robin Davis (2010)

### ■ Without Biodegradation

- Higher foundation airflow,
- Higher indoor air concentration

### ■ With Aerobic Biodegradation

- Higher foundation airflow,
- Lower indoor air concentration
- (if oxygen limited)

Model Estimates (BioVapor, [www.api.org/vi](http://www.api.org/vi))  
Residential default parameters, varied foundation airflow

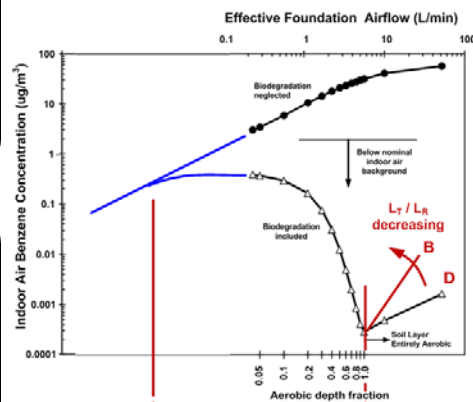

45

## Model Application 4A: Scenario Type Classification

### Type C: Oxygen Deficient

### Type A: (Oxygen) Transport-Limited

Type C  
Type A  
Type B ~ L<sub>T</sub> / L<sub>R</sub> < 4  
Type D ~ L<sub>T</sub> / L<sub>R</sub> > 4

### Type D: Low Diffusion (compared to degradation)

### Type B: Biodegradation Rate - Limited

Profile Type Classes from: Roggemans, et al., 2001: API Soil and Groundwater Research Bulletin No. 15.

46

## Soil Gas Profile Interpretations

Biodegradation Model helps classify ranges of behavior:

47

## Sensitivity Analysis 1:

### BioVapor User's Guide:

- "Some required or optional model inputs parameters such as oxygen concentration below the building foundation and baseline soil oxygen respiration rate are not commonly measured during site investigation. **...the user should conduct a sensitivity analysis in order to evaluate the effect of input parameter value uncertainty on the model results"**
- "Users of this model should not rely exclusively on the information contained in this document. Sound business, scientific, engineering, and safety judgment should be used in employing the information contained herein."
- Neither API nor any....

Weaver, J. (2012). BioVapor Model Evaluation, For 23rd National Tanks Conference Workshop St. Louis, Missouri, March 18, 2012

48

## Sensitivity Analysis 2:

### *BioVapor versus Johnson and Ettinger:*

- **Parameter importance ranking**
  - **Primary**
    - Depth, source concentration
    - Oxygen content, biodegradation rate, foundation air flow, soil moisture content
  - **Secondary**
    - Air exchange rate, other factors in J&E
  - **Results will be more strongly dependent on source depth and strength than analogous J&E, and unless the source is right below foundation, less dependent on building parameters.**

---

Weaver, J. (2012). BioVapor Model Evaluation, For 23rd National Tanks Conference Workshop St. Louis, Missouri, March 18, 2012.  
Picone, S. et al., 2012: Environmental Toxicology and Chemistry, Vol. 31, No. 5, pp. 1042–1052, 2012.

49

## BioVapor Model: Forward Plan

- **Use:**
  - **Improved Understanding, Oxygen Requirements, Sensitivity**
    - Baseline Site Screening, Sample Plan Development, Training
    - What-if Analysis ( foundation / no foundation, etc.)
    - It is .. a model
- **Review and Plans:**
  - Validation and sensitivity analysis (EPA OUST, ORD)
  - EPA: recoding
  - API Workshop: Interactive Demonstration / Case Studies
  - Fixes and Updates: Very Few 'Bugs' or Model Issues to Date

50

51

## Workshop Agenda

- Welcome, Introductions, Safety Issues
- Update on ITRC VI Workgroup
- Update on EPA OUST
- PVI Overview; BioVapor and other models; and **Introduction to Exclusion Criteria**
- Evaluating the Vapor Intrusion Pathway - Studies **45 minutes**
- Regulatory updates effecting sampling and Analysis
- Case Studies/ Lessons
- Summary

52

## State Summary

### ■ 35 States with Vapor Intrusion Guidance

#### Screening Values:

<u>media</u>	<u>values</u>	<u>range</u>
indoor air	0.084 to 4.98 ug/m <sup>3</sup>	140x
groundwater	2.4 to 3500 ug/L	1500x
shallow soil gas	3.1 to 190,000 ug/m <sup>3</sup>	61,000x

Clearly, a lot of variability

Eklund, B., L. Beckley, V. Yates, T. E. McHugh, Overview of State Approaches to Vapor Intrusion, Remediation, Autumn 2012, 7-20.

53

## Petroleum Hydrocarbons And Chlorinated Hydrocarbons Differ In Their Potential For Vapor Intrusion

USEPA OUST 2011 <http://epa.gov/OUST/cat/pvi/index.htm>

Figure 1. Typical petroleum hydrocarbon transport conceptual scenario

Aerobic biodegradation of PHCs along the perimeter of the vapor and dissolved plumes limits subsurface contaminant spreading. Effective oxygen transport (dashed arrows) maintains aerobic conditions in the biodegradation zone. Petroleum LNAPL (light nonaqueous phase liquid) collects at the groundwater surface (the water table, blue triangle).

Figure 2. Typical chlorinated solvent transport conceptual scenario

Biodegradation of CHCs is anaerobic and usually slower than PHC biodegradation, so that the vapor and dissolved plumes often migrate farther than PHC plumes. CHC DNAPL (dense nonaqueous-phase liquid), if present, can sink below the water table, collecting in this case on a less penetrable layer.

54

## Scenario Type Classification

- Lower Concentration Source

- Dissolved Groundwater Source
- Clean Soil Model
- Lower VOC flux
- Lower Oxygen Demand

- Higher Concentration Source

- LNAPL Source
- Dirty Soil Model
- Higher VOC Flux
- Higher Oxygen Demand

55

## Exclusion Distances

- Distance is a much more robust screening factor than an attenuation ratio.

Increase separation distance by a factor of 2, attenuation factor decreases by a factor of 8E-06

DeVaull, G. E., *Environ. Sci. Technol.* 2007, 41, 3241-3248.

56

## Exclusion distance

### ■ Scatter plot – soil gas vs. distance from water table

Lahvis, M.A., et al., Vapor Intrusion Screening at Petroleum UST Sites, *Groundwater Monitoring and Remediation* [Article first published online: 21 Feb 2013].

57

## Petroleum Vapor Exclusion Distances

- 23 states - Range: 5 ft to 100 ft – dissolved phase.
  - Eklund, et al. 2012
- Site Vapor Database review:
  - Dissolved : 0 feet; 5 ft;
  - LNAPL: 15 ft
  - Lahvis et al., GWMR, online: 21 Feb 2013.
- Proposed:
  - LNAPL : 15 to 30 feet
  - Dissolved phase : somewhat less
  - Added factors of conservatism: ???
